Profile

AI safety and alignment researcher and final-year UIUC CS Ph.D. candidate (expected 2027), visiting Stanford STAIR. Founder of **Inside AI Safety, Inc.**, an independent nonprofit AI safety research organization. Develop representation-level safety evaluation, preference optimization, and selective intervention methods that preserve model utility. First/co-first-authored work at NeurIPS, ICLR, and TMLR, with foundations in adversarial robustness and domain adaptation. At Meta, built image/video generation methods for production pipelines and ran multi-node, multi-GPU training with FSDP.

Technical Expertise

LLM Safety	Representation-level safety audits, token/embedding-level adversarial testing, reasoning robustness evaluation, selective safety LoRA adapters.
Alignment Training	Offline preference optimization (DPO, SimPO), latent adversarial regularization, policy/reference representation alignment.
RL & Agents	Familiarity with GRPO, RLHF, agent rollouts, tool-use, and multi-turn trajectory training.
Distributed Training	PyTorch, FSDP, multi-node/multi-GPU model training.
Multimodal Models	Image/video generation, diffusion models, distillation, generation acceleration, production pipeline integration.
Robust Learning	Adversarial and certified training, multi-norm threat models, distribution shift, federated learning, domain adaptation.
Engineering	Python, NumPy, pandas, scikit-learn, C/C++, Java, Linux, Bash, Git.

Education

University of Illinois Urbana-Champaign — Ph.D. expected 2027

Ph.D., Computer Science (M.S. 2023).

UIUC / Zhejiang University, ZJU-UIUC Institute — 2016 – 2020

B.S., Computer Engineering (UIUC, Highest Honors); B.Eng., Electronics and Computer Engineering (ZJU).

Experience

Stanford University

2026 – Present | Stanford, CA

Visiting Student Researcher, Stanford Trustworthy AI Research (STAIR) Lab

- Co-led **CLEAR**, using a hidden-state gate to control a safety LoRA adapter. Reduced HarmBench attack success from **32.3% to 0.5%** on Llama-3-8B-Instruct, with up to **7.1 percentage points higher GSM8K accuracy** than globally applied safety SFT or LoRA.
- Developed representation-level safety auditing and a Latent Vulnerability Score. Across three model families, constructed models showed **2.5–3.1× the vulnerability** of aligned bases at the targeted middle layer despite safe-looking outputs.

Meta

Summers 2025 & 2026 | Menlo Park, CA

Research Intern | Image & Video Generation

- Developed diffusion distillation and acceleration methods for image/video generation; work was integrated into Meta's **production pipeline**.
- Ran **multi-node, multi-GPU training with PyTorch FSDP** for image/video generation models.
- Received an **internship return offer**.

Argonne National Laboratory

Jun – Aug 2023 | Remote

Research Intern

- Integrated federated domain adaptation algorithms into open-source APPFL; reproduced results and implemented custom losses and evaluation metrics with the team.

TensorOpera AI (formerly FedML)

Feb – May 2023 | Remote

Research Intern

- Developed federated learning algorithms across four hospital silos; explored diffusion models and self-supervised learning with limited data.

Tencent AI Lab Dec 2020 – Apr 2021 | Guangdong, China

NLP Intern

- Designed Chinese word segmentation labeling standards and a benchmark spanning difficult cases and diverse domains; cleaned word embeddings and first-authored the associated patent application.

Research: AI Safety & Alignment

- **Selective safety intervention | CLEAR:** Co-led continuous hidden-state routing of a safety adapter, intervening selectively while preserving benign capabilities; evaluated the safety–utility tradeoff against global safety SFT and LoRA. [Paper]
- **Representation-level evaluation | Audit gap:** Constructed models that appear safe under static behavioral audits yet remain vulnerable to bounded internal perturbations. Developed intervention-based auditing and a Latent Vulnerability Score to quantify this gap. [Paper]
- **Preference optimization | GANPO:** Designed a plug-in latent adversarial regularizer that aligns policy/reference representation distributions, complementing token-level objectives in DPO and SimPO. Improved robustness under distribution shift and high-entropy sampling with minor computational overhead and comparable downstream performance. [Code]
- **Reasoning safety | MATCHA:** Built answer-conditioned token- and embedding-level adversarial probes and an automated evaluation framework. Showed that correct answers can coexist with inconsistent reasoning, identified greater fragility in multi-step and commonsense tasks, and studied transfer to black-box LLMs. [Code]
- **Robustness foundations | RAMP/CURE:** Developed logit pairing and gradient projection to balance accuracy and competing multi-norm adversarial objectives; extended robustness to certified training through bound alignment and training strategies.

Research: Applied AI

- **Climate AI | PyroAdapt:** Built a pretrain–retrieve–rank framework for wildfire prediction under spatial heterogeneity and temporal shift. Across California, raised daily average precision from **21.62% to 24.57%** and Top-5% recall from **18.70% to 22.79%**, capturing **344 additional positive cell-days** under a fixed detection budget.
- **Healthcare AI | Federated domain adaptation:** Designed gradient projection and auto-weighted aggregation to combine source and target model updates under domain shift. Improved adaptation with limited target data across healthcare and general datasets; studied demographic information as auxiliary signals for COVID-19 imaging in MIDRC.
